STORMWATER SUMMARY

Project: Effingham Gas Station

Issue Date: August 26, 2022

Applicant : Meena LLC

Revised: December 19, 2023

Project No : 220473

Location : 41 Route 25, Effingham, NH

PID : Map 401, Lot 5

Methodology : TR-20 using HydroCAD® 10.20-3g

Assumption(s):

- The “Existing Site Conditions” are the conditions that the site was in prior to the construction of the gas pumps, tank and canopy.
- Storm events have been used in these calculations under fully thawed ground conditions, antecedent moisture content two.

Approach:

- Review and verify, stormwater runoff flows from the concrete pads and parking lots.
- Identify potential oil and spill sources and install devices to keep fugitive oil from reaching the adjacent wetlands.
- Note that the site is all within Champlain Soils that are considered excessively well drained, and a droughty soil per NRCS Soils Mapping and Classification. The Hydrologic Soils Group for Colton soils is group A.
- Stormwater analysis completed was to determine the amount of flow to the NHDOT right of way and design an infiltration trench to treat the runoff from the canopy.
- The analysis is limited to the watershed on the project site.

Summary of Analysis:

Analysis

Point	2yr	10yr	25yr	50yr
POA1 EX	2.35cfs	3.44cfs	4.28cfs	5.33cfs
POST	2.11cfs	3.13cfs	3.91cfs	5.13cfs

Town of Effingham Performance Standards:

The following in *italics* are the Zoning performance standards listed in Section 2210 and our narrative discussing how the project meets the standards is list directly below the standard:

2210 - 1. For any use that will render impervious more than 15% or more than 2,500 square feet of the groundwater protection district area of any lot, whichever is greater, a stormwater management plan shall be prepared which the planning board determines is consistent with New Hampshire Stormwater Manual Volumes 1-3, NH Department of Environmental Services December 2008 or any subsequent revisions.

Horizons Engineering, Inc.

MAINE • NEW HAMPSHIRE • VERMONT

The site has more than 15% impervious and 2,500 SF of impervious area within the groundwater protection district. Therefore, a stormwater/source control plan, narrative is included in this response, see attached revised SPCC & Source Control Plan.

- 2210 - 2. *Special uses, as defined under Section 2208, Special Uses, shall develop stormwater management and pollution prevention plans and include information consistent with Developing Your Stormwater Pollution Prevention Plan: A Guide for Construction Sites, US EPA #833R06004, May 2007 or any subsequent revisions. The plan shall demonstrate that the use will: a. Meet minimum stormwater discharge setbacks between water supply wells and constructed stormwater practices as found within Innovative Land Use Planning Techniques: A Handbook for Sustainable Development, Section 2.1 Permanent (Post-Construction) Stormwater Management, (DES, 2008 or later edition); b. Minimize, through a source control plan that identifies pollution prevention measures, the release of regulated substances into stormwater; c. Stipulate that expansion or redevelopment activities shall require an amended stormwater plan and may not infiltrate stormwater through areas containing contaminated soils without completing a Phase I Assessment in conformance with ASTM E 1527-05, also referred to as All Appropriate Inquiry (AAI); d. Maintain the following minimum vertical separation between the bottom of a stormwater practice and the average seasonal highwater table as determined by a licensed hydrogeologist, soil scientist, engineer or other qualified professional as determined by the Planning Board: four-foot vertical separation for a practice that infiltrates stormwater; one-foot vertical separation for a practice that filters stormwater.*

The revised plans and reports include a stormwater management plan, source control plan and a pollution prevention plan. We have removed the infiltration system and replaced it with a new bioretention basin per North Points recommendations, and the new system maintains the required one-foot of separation to the average seasonal high water elevation.

- 2210 - 3. *Animal manures, fertilizers, and compost must be stored in accordance with Manual of Best Management Practices for Agriculture in New Hampshire, NH Department of Agriculture, Markets, and Food, July 2008 and any subsequent revisions.*

The project is a fueling station and does not anticipate or plan on storing manure, fertilizers, or composts at the project site. No above ground fuel storage.

- 2210 - 4. *All regulated substances stored in containers with a capacity of five gallons or more must be stored in product-tight containers on an impervious surface designed and maintained to prevent flow to exposed soils, floor drains, and outside drains;*

The project does not propose to store regulated substances in above ground containers that are larger than 5 gallons. Fueling stations are protected with concrete slabs that include Positive Limiting Barriers (PLB), that will direct excessive spills, should this occur to a series of additional protective stormwater devices; deep sump catch basins, oil water separator, and lined bioretention system. Runoff from the canopy goes to the infiltration trench. Treatment devices are in accordance with Stormwater Manuals and Source Control Plans.

- 2210 - 5. *Facilities where regulated substances are stored must be secured against unauthorized entry by means of a door and/or gate that is locked when authorized personnel are not present and must be inspected weekly by the facility owner;*

Horizons Engineering, Inc.

MAINE • NEW HAMPSHIRE • VERMONT

There are no special facilities or above ground storage containers proposed, and the main building will be locked, or under employee supervision at all times and shall be inspected by the facility owner.

2210 - 6. *Outdoor storage areas for regulated substances, associated material or waste must be protected from exposure to precipitation and must be located at least 50 feet from surface water or storm drains, at least 75 feet from private wells, and outside the sanitary protective radius of wells used by public water systems.*

The project does not propose outdoor, above ground storage containers for regulated substances. A screened in solid waste dumpster is proposed at a location that not within the sanitary protective radius of wells used by the public water system.

2210 - 7. *Secondary containment must be provided for outdoor storage of regulated substances in regulated containers and the containment structure must include a cover to minimize accumulation of water in the containment area and contact between precipitation and storage container(s);*

The project does not propose outdoor, above ground storage containers for regulated substances, and therefore secondary containment is not provided. Fueling stations are protected with a concrete slab that includes PLB. Precipitation runoff will be directed to a series of stormwater devices; deep sump catch basin, oil water separator, and a bioretention system.

2210 - 8. *Containers in which regulated substances are stored must be clearly and visibly labeled and must be kept closed and sealed when material is not being transferred from one container to another;*

There are no outdoor, above ground storage containers/areas proposed at the project site. Fueling stations, and the solid waste dumpster will be clearly labeled, and kept closed and sealed when material is not being transferred.

2210 - 9. *Prior to any land disturbing activities, all inactive wells on the property not in use or properly maintained at the time the plan is submitted shall be considered abandoned and must be decommissioned in accordance with We 604, or must be properly maintained in accordance with We 603 of the New Hampshire Water Well Board Rules. Rev 3/11/22 57 of 70*

There are no inactive wells on the project site.

2210 - 10. *Blasting activities shall be planned and conducted to minimize groundwater contamination. Excavation activities should be planned and conducted to minimize adverse impacts to hydrology and the dewatering of nearby drinking water supply wells.*

The project does not anticipate requiring blasting activities during construction.

Horizons Engineering, Inc.

MAINE • NEW HAMPSHIRE • VERMONT

2210 - 11. All transfers of petroleum from delivery trucks and storage containers over five gallons in capacity shall be conducted over an impervious surface having a positive limiting barrier at its perimeter.

The fueling pads have positive limiting barriers at their perimeters.

Conclusions:

- Stormwater runoff from the parking lot and buildings is directed to deep sump catch basins and an oil water separator. These are intended to capture the runoff and prevent any fugitive oil from reaching the adjacent wetlands. The runoff from the proposed canopy is directed to an infiltration trench, where the runoff will be captured, infiltrated and treated. There will be a post development decrease in peak rate at the analysis point due to the construction of the infiltration trench and bioretention basin and no change in impervious surfaces. Additionally, infiltration trench, catch basins, and bio-retention basin will add a level of protection not previously available.

Horizons Engineering, Inc.

Subject: RE: Meena Effingham

James, I don't foresee any issue with the tank or trench. And as I indicated this morning, the pole is set deeper than normal, so I don't believe the amount of material you indicated will be removed will have any effect. But again, should any questions or concerns arise during any phase of construction, please don't hesitate to call.

Brad

Good Morning Brad,

Thank you for taking the time to meet with us on site at the Meena project this morning. I wanted to confirm what we discussed on site, in that Eversource does not have an issue with the underground tank, infiltration trench and bio-retention rain garden in the easement, and that the pole within the side slope of the stormwater pond does not need to be moved. Thanks again

James Hayden

FILTRATION PRACTICE DESIGN CRITERIA (Env-Wq 1508.07)

Type/Node Name: _____ **p-5 Bioretention basin**

Enter the type of filtration practice (e.g., bioretention system) and the node name in the drainage analysis, if applicable.

		Check if you reviewed the restrictions on unlined systems outlined in Env-Wq 1508.07(a).	
0.31	ac	A = Area draining to the practice	
0.26	ac	A _I = Impervious area draining to the practice	
0.84	decimal	I = Percent impervious area draining to the practice, in decimal form	
0.80	unitless	R _v = Runoff coefficient = 0.05 + (0.9 x I)	
0.25	ac-in	WQV = 1" x R _v x A	
906	cf	WQV conversion (ac-in x 43,560 sf/ac x 1ft/12")	
226	cf	25% x WQV (check calc for sediment forebay volume)	
679	cf	75% x WQV (check calc for surface sand filter volume)	
Deep sump CBs		Method of Pretreatment? (not required for clean or roof runoff)	
N/A	cf	V _{SED} = Sediment forebay volume, if used for pretreatment	≥ 25%WQV
Calculate time to drain if system IS NOT underdrained:			
45	sf	A _{SA} = Surface area of the practice	
10.00	iph	K _{sat} _{DESIGN} = Design infiltration rate ¹	
		If K _{sat} (prior to factor of safety) is < 0.50 iph, has an underdrain been provided? (Use the calculations below)	
yes	Yes/No		
24.2	hours	T _{DRAIN} = Drain time = V / (A _{SA} * I _{DESIGN})	≤ 72-hrs
Calculate time to drain if system IS underdrained:			
	ft	E _{WQV} = Elevation of WQV (attach stage-storage table)	
	cfs	Q _{WQV} = Discharge at the E _{WQV} (attach stage-discharge table)	
-	hours	T _{DRAIN} = Drain time = 2WQV/Q _{WQV}	≤ 72-hrs
416.50	feet	E _{FC} = Elevation of the bottom of the filter course material ²	
415.50	feet	E _{UD} = Invert elevation of the underdrain (UD), if applicable	
415.50	feet	E _{SHWT} = Elevation of SHWT (if none found, enter the lowest elevation of the test pit)	
412.25	feet	E _{ROCK} = Elevation of bedrock (if none found, enter the lowest elevation of the test pit)	
1.00	feet	D _{FC to UD} = Depth to UD from the bottom of the filter course	≥ 1'
4.25	feet	D _{FC to ROCK} = Depth to bedrock from the bottom of the filter course	≥ 1'
1.00	feet	D _{FC to SHWT} = Depth to SHWT from the bottom of the filter course	≥ 1'
421.70	ft	Peak elevation of the 50-year storm event (infiltration can be used in analysis)	
422.00	ft	Elevation of the top of the practice	
YES		50 peak elevation ≤ Elevation of the top of the practice	← yes
If a surface sand filter or underground sand filter is proposed:			
YES	ac	Drainage Area check.	< 10 ac
	cf	V = Volume of storage ³ (attach a stage-storage table)	≥ 75%WQV
	inches	D _{FC} = Filter course thickness	18", or 24" if within GPA
Sheet		Note what sheet in the plan set contains the filter course specification.	
Yes/No		Access grate provided?	← yes
